

**PYRIMIDINE DERIVATIVES FOR THE TREATMENT OF ABNORMAL CELL
GROWTH**

Cross-Reference to Related Application

This patent application claims priority to U.S. Patent Application Serial No. 5 60/435,670, filed December 20, 2002 (Attorney Docket No. PC25339), and U.S. Patent Application Serial No. 60/500,742, filed September 5, 2003 (Attorney Docket No. PC25937).

Background of the Invention

This invention relates to novel pyrimidine derivatives that are useful in the treatment of abnormal cell growth, such as cancer, in mammals. This invention also relates to a method of 10 using such compounds in the treatment of abnormal cell growth in mammals, especially humans, and to pharmaceutical compositions containing such compounds.

It is known that a cell may become cancerous by virtue of the transformation of a portion of its DNA into an oncogene (i.e., a gene which, on activation, leads to the formation of malignant tumor cells). Many oncogenes encode proteins that are aberrant tyrosine kinases 15 capable of causing cell transformation. Alternatively, the overexpression of a normal proto-oncogenic tyrosine kinase may also result in proliferative disorders, sometimes resulting in a malignant phenotype.

Receptor tyrosine kinases are enzymes which span the cell membrane and possess an extracellular binding domain for growth factors such as epidermal growth factor, a 20 transmembrane domain, and an intracellular portion which functions as a kinase to phosphorylate specific tyrosine residues in proteins and hence to influence cell proliferation. Other receptor tyrosine kinases include c-erbB-2, c-met, tie-2, PDGFr, FGFr, and VEGFR. It is known that such kinases are frequently aberrantly expressed in common human cancers such as breast cancer, gastrointestinal cancer such as colon, rectal or stomach cancer, leukemia, 25 and ovarian, bronchial or pancreatic cancer. It has also been shown that epidermal growth factor receptor (EGFR), which possesses tyrosine kinase activity, is mutated and/or overexpressed in many human cancers such as brain, lung, squamous cell, bladder, gastric, breast, head and neck, oesophageal, gynecological and thyroid tumors.

Accordingly, it has been recognized that inhibitors of receptor tyrosine kinases are 30 useful as selective inhibitors of the growth of mammalian cancer cells. For example, erbstatin, a tyrosine kinase inhibitor, selectively attenuates the growth in athymic nude mice of a transplanted human mammary carcinoma that expresses epidermal growth factor receptor tyrosine kinase (EGFR) but is without effect on the growth of another carcinoma that does not express the EGF receptor. Thus, selective inhibitors of certain receptor tyrosine kinases, are 35 useful in the treatment of abnormal cell growth, in particular cancer, in mammals. In addition to receptor tyrosine kinases, selective inhibitors of certain non-receptor tyrosine kinases, such as

FAK (focal adhesion kinase), lck, src, abl or serine/threonine kinases (e.g.: cyclin dependent kinases, are useful in the treatment of abnormal cell growth, in particular cancer, in mammals. FAK is also known as the Protein-Tyrosine Kinase 2, PTK2.

5 Convincing evidence suggests that FAK, a cytoplasmic, non-receptor tyrosine kinase, plays an essential role in cell-matrix signal transduction pathways (Clark and Brugge 1995, Science 268: 233-239) and its aberrant activation is associated with an increase in the metastatic potential of tumors (Owens et al. 1995, Cancer Research 55: 2752-2755). FAK was originally identified as a 125 kDa protein highly tyrosine-phosphorylated in cells transformed by v-Src. FAK was subsequently found to be a tyrosine kinase that localizes to
10 focal adhesions, which are contact points between cultured cells and their underlying substratum and sites of intense tyrosine phosphorylation. FAK is phosphorylated and, thus, activated in response to extracellular matrix (ECM)-binding to integrins. Recently, studies have demonstrated that an increase in FAK mRNA levels accompanied invasive transformation of tumors and attenuation of the expression of FAK (through the use of
15 antisense oligonucleotides) induces apoptosis in tumor cells (Xu et al. 1996, Cell Growth and Diff. 7: 413-418). In addition to being expressed in most tissue types, FAK is found at elevated levels in most human cancers, particularly in highly invasive metastases.

Various compounds, such as styrene derivatives, have also been shown to possess tyrosine kinase inhibitory properties. Five European patent publications, namely EP 0 566 226
20 A1 (published October 20, 1993), EP 0 602 851 A1 (published June 22, 1994), EP 0 635 507 A1 (published January 25, 1995), EP 0 635 498 A1 (published January 25, 1995), and EP 0 520 722 A1 (published December 30, 1992), refer to certain bicyclic derivatives, in particular quinazoline derivatives, as possessing anti-cancer properties that result from their tyrosine kinase inhibitory properties.

25 Also, World Patent Application WO 92/20642 (published November 26, 1992), refers to certain bis-mono and bicyclic aryl and heteroaryl compounds as tyrosine kinase inhibitors that are useful in inhibiting abnormal cell proliferation. World Patent Applications WO96/16960 (published June 6, 1996), WO 96/09294 (published March 6, 1996), WO 97/30034 (published August 21, 1997), WO 98/02434 (published January 22, 1998), WO 98/02437 (published
30 January 22, 1998), and WO 98/02438 (published January 22, 1998), also refer to substituted bicyclic heteroaromatic derivatives as tyrosine kinase inhibitors that are useful for the same purpose.

U.S. Patent Application Serial No. 60/435,670, filed December 20, 2002 (Attorney Docket No. PC25339) relates to a broad class of novel pyrimidine derivatives that are selective
35 inhibitors of FAK. As such, these compounds are useful in the treatment of abnormal cell growth.

Accordingly, a need exists for additional selective inhibitors of certain receptor and non-receptor tyrosine kinases, useful in the treatment of abnormal cell growth, such as cancer, in mammals. The present invention provides for novel pyrimidine derivatives that are selective inhibitors of the non-receptor tyrosine kinase, FAK, and are useful in the treatment of abnormal cell growth.

The present invention also includes isotopically-labeled compounds, which are identical to those recited in Formula 1, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine and chlorine, such as ²H, ³H, ¹³C, ¹⁴C, ¹⁵N, ¹⁸O, ¹⁷O, ³¹P, ³²P, ³⁵S, ¹⁸F, and ³⁶Cl, respectively. Compounds of the present invention, prodrugs thereof, and pharmaceutically acceptable salts of said compounds or of said prodrugs which contain the aforementioned isotopes and/or other isotopes of other atoms are within the scope of this invention. Certain isotopically-labelled compounds of the present invention, for example those into which radioactive isotopes such as ³H and ¹⁴C are incorporated, are useful in drug and/or substrate tissue distribution assays. Tritiated, i.e., ³H, and carbon-14, i.e., ¹⁴C, isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with heavier isotopes such as deuterium, i.e., ²H, can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased *in vivo* half-life or reduced dosage requirements and, hence, may be preferred in some circumstances. Isotopically-labelled compounds of Formula 1 of this invention and prodrugs thereof can generally be prepared by carrying out the procedures disclosed in the Schemes and/or in the Examples and Preparations below, by substituting a readily available isotopically-labelled reagent for a non-isotopically-labelled reagent.

The present invention also relates to the pharmaceutically acceptable acid addition salts of compounds of the formula 1. The acids which are used to prepare the pharmaceutically acceptable acid addition salts of the aforementioned base compounds of this invention are those which form non-toxic acid addition salts, i.e., salts containing pharmacologically acceptable anions, such as the chloride, bromide, iodide, nitrate, sulfate, bisulfate, phosphate, acid phosphate, acetate, lactate, citrate, acid citrate, tartrate, bitartrate, succinate, maleate, fumarate, gluconate, saccharate, benzoate, methanesulfonate, ethanesulfonate, benzenesulfonate, p-toluenesulfonate and pamoate [i.e., 1,1'-methylene-bis-(2-hydroxy-3-naphthoate)]salts.

The invention also relates to base addition salts of formula 1. The chemical bases that may be used as reagents to prepare pharmaceutically acceptable base salts of those compounds of formula 1 that are acidic in nature are those that form non-toxic base salts with such compounds. Such non-toxic base salts include, but are not limited to those derived from such pharmacologically acceptable cations such as alkali metal cations (e.g., potassium and sodium) and alkaline earth metal cations (e.g., calcium and magnesium), ammonium or water-soluble amine addition salts such as N-methylglucamine-(meglumine), and the lower alkanolammonium and other base salts of pharmaceutically acceptable organic amines.

The phrase "pharmaceutically acceptable salt(s)", as used herein, unless otherwise indicated, includes salts of acidic or basic groups which may be present in the compounds of the present invention. The compounds of the present invention that are basic in nature are capable of forming a wide variety of salts with various inorganic and organic acids. The acids that may be used to prepare pharmaceutically acceptable acid addition salts of such basic compounds of are those that form non-toxic acid addition salts, i.e., salts containing pharmacologically acceptable anions, such as the hydrochloride, hydrobromide, hydroiodide, nitrate, sulfate, bisulfate, phosphate, acid phosphate, isonicotinate, acetate, lactate, salicylate, citrate, acid citrate, tartrate, pantothenate, bitartrate, ascorbate, succinate, maleate, gentisinate, fumarate, gluconate, glucuronate, saccharate, formate, benzoate, glutamate, methanesulfonate, ethanesulfonate, benzenesulfonate, p-toluenesulfonate and pamoate [i.e., 1,1'-methylene-bis-(2-hydroxy-3-naphthoate)] salts. The compounds of the present invention that include a basic moiety, such as an amino group, may form pharmaceutically acceptable salts with various amino acids, in addition to the acids mentioned above.

This invention also encompasses pharmaceutical compositions containing prodrugs of compounds of the formula 1. Compounds of formula 1 having free amino, amido, hydroxy or carboxylic groups can be converted into prodrugs. Prodrugs include compounds wherein an amino acid residue, or a polypeptide chain of two or more (e.g., two, three or four) amino acid residues which are covalently joined through peptide bonds to free amino, hydroxy or carboxylic

acid groups of compounds of formula 1. The amino acid residues include the 20 naturally occurring amino acids commonly designated by three letter symbols and also include, 4-hydroxyproline, hydroxylysine, demosine, isodemosine, 3-methylhistidine, norvalin, beta-alanine, gamma-aminobutyric acid, citrulline, homocysteine, homoserine, ornithine and methionine sulfone. Prodrugs also include compounds wherein carbonates, carbamates, amides and alkyl esters that are covalently bonded to the above substituents of formula 1 through the carbonyl carbon prodrug sidechain.

This invention also encompasses compounds of formula 1 containing protective groups. One skilled in the art will also appreciate that compounds of the invention can also be prepared with certain protecting groups that are useful for purification or storage and can be removed before administration to a patient. The protection and deprotection of functional groups is described in "Protective Groups in Organic Chemistry", edited by J.W.F. McOmie, Plenum Press (1973) and "Protective Groups in Organic Synthesis", 3rd edition, T.W. Greene and P.G.M. Wuts, Wiley-Interscience (1999).

The compounds of this invention include all stereoisomers (e.g., cis and trans isomers) and all optical isomers of compounds of the formula 1 (e.g., R and S enantiomers), as well as racemic, diastereomeric and other mixtures of such isomers.

The compounds, salts and prodrugs of the present invention can exist in several tautomeric forms, including the enol and imine form, and the keto and enamine form and geometric isomers and mixtures thereof. All such tautomeric forms are included within the scope of the present invention. Tautomers exist as mixtures of a tautomeric set in solution. In solid form, usually one tautomer predominates. Even though one tautomer may be described, the present invention includes all tautomers of the present compounds.

The present invention also includes atropisomers of the present invention. Atropisomers refer to compounds of formula 1 that can be separated into rotationally restricted isomers.

The compounds of this invention may contain olefin-like double bonds. When such bonds are present, the compounds of the invention exist as cis and trans configurations and as mixtures thereof.

Detailed Description of the Invention

The compounds of formula 1 can be prepared using the synthetic route outlined in Scheme 1. The substituents in Scheme 1 have the same meaning as the substituents defined for formula 1.

Scheme 1

Compounds of formula 1 can be prepared starting from the 5-amino-oxindole (2) and pyrimidine (3). Combining 3 with an equimolar amount of a Lewis Acid at temperatures ranging from -15 to 45°C for a time period of 10-60 minutes in an inert solvent (or solvent mixture) followed by addition of 2 and a suitable base provides after the period of 1-24 h the intermediate 4-chloropyrimidine (4) in high yields. Examples of inert solvents include but are not limited to THF, 1,4-dioxane, n-BuOH, i-PrOH, dichloromethane and 1,2-dichloroethane. Examples of suitable bases employed may include but are not limited to (i) non-nucleophilic organic bases for example triethylamine or diisopropylethylamine (ii) inorganic bases such as potassium carbonate or cesium carbonate or (iii) resin bound bases such as MP-carbonate.

Examples of Lewis Acids include but are not limited to halide salts of magnesium, copper, zinc, tin or titanium. In the next reaction, intermediate 4 is reacted with an amine of the

formula 5 either neat or in the presence of an inert solvent (or solvent mixture) at temperatures ranging from 0 to 150°C to provide the compounds of formula 1. Optionally this reaction can be run in the presence of a suitable base. Examples of suitable solvents for this reaction include but are not limited to THF, 1,4-dioxane, DMF, N-methyl-pyrrolidinone, EtOH, n-BuOH, i-PrOH, 5 dichloromethane, 1,2-dichloroethane, DMSO or acetonitrile. Suitable bases are as outlined above.

Compounds of the present invention may be synthetically transformed into other compounds of the invention by techniques known to those skilled in the art. Simply for illustrative purposes and without limitation, such methods include:

10 a) removal of a protecting group by methods outlined in T. W. Greene and P.G.M. Wuts, "Protective Groups in Organic Synthesis", Second Edition, John Wiley and Sons, New York, 1991; e.g., removal of a BOC protecting group with an acid source such as HCl or trifluoroacetic acid.

15 b) displacement of a leaving group (halide, mesylate, tosylate, etc) with functional groups such as but not limited to a primary or secondary amine, thiol or alcohol to form a secondary or tertiary amine, thioether or ether, respectively.

c) treatment of phenyl (or substituted phenyl) carbamates with primary or secondary amines to form the corresponding ureas as in Thavonekham, B et. al. Synthesis (1997), 10, p1189;

20 d) reduction of propargyl or homopropargyl alcohols or N-BOC protected primary amines to the corresponding E-allylic or E-homoallylic derivatives by treatment with sodium bis(2-methoxyethoxy)aluminum hydride (Red-Al) as in Denmark, S. E.; Jones, T. K. J. Org. Chem. (1982) 47, 4595-4597 or van Benthem, R. A. T. M.; Michels, J. J.; Speckamp, W. N. Synlett (1994), 368-370;

25 e) reduction of alkynes to the corresponding Z-alkene derivatives by treatment with hydrogen gas and a Pd catalyst as in Tomassy, B. et. al. Synth. Commun. (1998), 28, p1201

f) treatment of primary and secondary amines with an isocyanate, acid chloride (or other activated carboxylic acid derivative), alkyl/aryl chloroformate or sulfonyl chloride to provide the corresponding urea, amide, carbamate or sulfonamide;

30 g) reductive amination of a primary or secondary amine using an aldehyde or ketone and an appropriate reducing reagent.

h) treatment of alcohols with an isocyanate, acid chloride (or other activated carboxylic acid derivative), alkyl/aryl chloroformate or sulfonyl chloride to provide the corresponding carbamate, ester, carbonate or sulfonic acid ester.

35 Amines of the formula 5 may be purchased and used directly or alternatively be prepared by one skilled in the art using ordinary chemical transformations. For example;

arylalkylamines or heteroarylalkylamines may be prepared from the corresponding nitrile by catalytic hydrogenation using catalysts such as Pd/C or Raney Nickel or by lithium aluminum hydride reduction, (see Rylander, Catalytic Hydrogenation in Organic Synthesis, Academic Press, 1979).

The nitrile starting materials can be either purchased or prepared from the corresponding aryl/heteroaryl bromide, iodide or triflate and $\text{Zn}(\text{CN})_2$ using Pd coupling conditions found in Tschaen, D. M., et. al Synthetic Communications (1994), 24, 6, pp 887-890.

Alternatively, benzylamines or heteroarylmethylamines can be prepared by reacting the appropriate arylalkyl or heteroarylalkyl halide and the potassium salt of $(\text{BOC})_2\text{NH}$ (reference) and subsequent removal of the BOC groups with acid.

Amines, protected forms of amines, precursors to amines and precursors to the protected forms of amines of formula 5 can be prepared by combining the appropriate alkyne, or alkenyl stannane, alkenyl borane, alkenyl boronic acid, boronic ester with the appropriate aryl or heteroaryl bromide, iodide or triflate using Pd coupling conditions as found in Tsuji, J.; Palladium Reagents and Catalysis, John Wiley and Sons 1999 and references cited therein.

Appropriately protected amines of formula 5 may be converted to different amines of formula 5 according to methods familiar to those skilled in the art for example as but limited to:

(a) oxidation of a thioether to a sulfoxide or sulfone.

(b) N-alkylation of a sulfanilide can be achieved under phase transfer using conditions described by Brehme, R. "Synthesis", (1976), pp113-114.

As understood by those skilled in the art, the chemical transformation to convert an aryl halide or triflate or heteroaryl halide or triflate to an aromatic or heteroaromatic amine may be carried out using conditions currently outlined in the literature, see Hartwig, J. F.: "Angew. Chem. Int. Ed." (1998), 37, pp. 2046-2067, Wolfe, J. P.; Wagaw, S.; Marcoux, J. F.; Buchwald, S.L.; "Acc. Chem. Res.", (1998), 31, pp 805-818, Wolfe, J. P.; Buchwald, S.L.; "J. Org. Chem.", (2000), 65, pp 1144-1157, Muci, A. R.; Buchwald, S. L.; "Topics in Current Chemistry" (2002), pp131-209 and references cited therein. Further, as understood by those skilled in the art, these same aryl or heteroaryl amination chemical transformations may alternatively be carried out on nitrile (or primary amide) precursors which provide amines of the formula 5 after nitrile (or amide) reduction. Protected amines of formula 5 may be further converted to different amines of formula 5 according to methods familiar to those skilled in the art.

2. Lyse cells with one pass on a microfluidizer

25 3. Remove cell debris by centrifugation at 4OC for 35 minutes at 14,000 rpm in a Sorval SLA-1500 rotor.

4. Transfer the supernatant to a clean tube and add 6.0 ml of Ni-NTA agarose (Qiagen)

5. Incubate the suspension with gentle rocking at 4OC for 1 hour

6. Centrifuge suspension at 700 x g in a swinging bucket rotor.

30 7. Discard the supernatant and resuspend the agarose beads in 20.0 ml of Buffer A

8. Transfer the beads to an XK-16 column (Amersham-Pharmacia) connected to a FPLCTM.

35 9. Wash the agarose-beads with 5 column volumes of Buffer A and elute off the column with a step gradient of Buffer A containing 300mM Imidazole.

10. Perform a buffer exchange of the eluted fractions into Buffer B

11. Following buffer exchange, pool the fractions and add thrombin at a 1:300 (w/w) ratio and incubated overnight at 13°C to remove the N-terminal His-tag (His-FAK410-698 → FAK410-689 (a.k.a. FAKcd)).

14. Aliquot the FAKcd protein and store frozen at -80°C

II. FAK activation

60ul Src Reaction Buffer (UpState Biotech.)

2. Incubate Reaction for at least 3 hours at room temperature

At time t_0 , almost all of the FAK(410-689) is singly phosphorylated. The second phosphorylation is slow. At t_{120} ($t = 120$ minutes), add 10ul of 150 mM ATP.

$T_0 = (\text{Start})$ 90% singly phosphorylated FAK(410-689) (1 PO₄)

$T_{43} = (43 \text{ min})$ 65% singly phosphorylated (1 PO₄), 35% doubly phosphorylated (2 PO₄)

$T_{90} = (90 \text{ min})$ 45% 1 PO₄, 55% 2 PO₄

$T_{150} = 15\%$ 1 PO₄, 85% 2 PO₄

III. FAKcd Kinase ELISA

1. Coat 96-well Nunc MaxiSorp plates with poly-glu-tyr (pGT) at 10 ug/well: Prepare 10 ug/ml of pGT in PBS and aliquot 100 ul/well. Incubate the plates at 37°C overnight, aspirate the supernatant, wash the plates 3 times with Wash Buffer, and flick to dry before storing at 4°C.

2. Prepare compound stock solutions of 2.5 mM in 100% DMSO. The stocks are subsequently diluted to 60X of the final concentration in 100% DMSO, and diluted 1:5 in Kinase Phosphorylation Buffer.
3. Prepare a 75 μ M working ATP solution in Kinase phosphorylation buffer. Add
5 80 μ l to each well for a final ATP concentration of 50 μ M.
4. Transfer 10 μ l of the diluted compounds (0.5log serial dilutions) to each well of the pGT assay plate, running each compound in triplicates on the same plate.
5. Dilute on ice, FAKcd protein to 1:1000 in Kinase Phosphorylation Buffer. Dispense 30 μ l per well.
- 10 6. Note: Linearity and the appropriate dilution must be pre-determined for each batch of protein. The enzyme concentration selected should be such that quantitation of the assay signal will be approximately 0.8-1.0 at OD450, and in the linear range of the reaction rate.
7. Prepare both a No ATP control (noise) and a No Compound Control (Signal):
- 15 8. (Noise) One blank row of wells receives 10 μ l of 1:5 diluted compounds in DMSO, 80 μ l of Phosphorylation buffer (minus ATP), and 30 μ l FAKcd solution.
9. (Signal) Control wells receive 10 μ l of 1:5 diluted DMSO (minus Compound) in Kinase phosphorylation buffer, 80 μ l of 75 μ M ATP, and 30 μ l of 1:1000 FAKcd enzyme.
10. Incubate reaction at room temperature for 15 minutes with gentle shaking on
20 a plate shaker.
11. Terminate the reaction by aspirating off the reaction mixture and washing 3 times with wash buffer.
12. Dilute phospho-tyrosine HRP-conjugated (pY20HRP) antibody to 0.250 μ g/ml (1:1000 of Stock) in blocking buffer. Dispense 100 μ l per well, and incubate with shaking for
25 30min. at R.T.
13. Aspirate the supernatant and wash the plate 3 times with wash buffer.
14. Add 100 μ l per well of room temperature TMB solution to initiate color development. Color development is terminated after approximately 15-30 sec. by the addition of 100 μ l of 0.09M H₂SO₄ per well.
- 30 15. The signal is quantitated by measurement of absorbance at 450nm on the BioRad microplate reader or a microplate reader capable of reading at OD450.
16. Inhibition of tyrosine kinase activity would result in a reduced absorbance signal. The signal is typically 0.8-1.0 OD units. The values are reported as IC_{50s}, μ M concentration.

- FAK cell-based Protocol for selectivity of kinase-dependent phosphoFAKY397

Procedure:

25 An inducible FAK cell-based assay in ELISA format for the screening of chemical matter to identify tyrosine kinase specific inhibitors was developed. The cell-based assay exploits the mechanism of the GeneSwitchTM system (InVitrogen) to exogenously control the expression and phosphorylation of FAK and the kinase-dependent autophosphorylation site at residue Y397.

30 Inhibition of the kinase-dependent autophosphorylation at Y397 results in a reduced absorbance signal at OD450. The signal is typically 0.9 to 1.5 OD450 units with the noise falling in the range of 0.08 to 0.1 OD450 units. The values are reported as IC₅₀s, μ M concentration.

35 On day 1, grow A431-FAKwt in T175 flasks. On the day prior to running the FAK cell-assay, seed A431-FAKwt cells in growth media on 96-well U-bottom plates. Allow cells to sit at 37°C, 5% CO₂ for 6 to 8 hours prior to FAK induction. Prepare Mifepristone stock solution of 10 μ M in 100 % Ethanol. The stock solution is subsequently diluted to 10 X of the final concentration in Growth Media. Transfer 10 μ l of this dilution (final concentration of 0.1 nM

Mifepristone) into each well. Allow cells to sit at 37°C, 5% CO₂ overnight (12 to 16 hours). Also, prepare control wells without Mifepristone induction of FAK expression and phosphorylation.

On day 2, coat Goat Anti-Rabbit plate(s) with 3.5 µg/ml of phosphospecific FAKpY397 polyclonal antibody prepared in SuperBlock TBS buffer, and allow plate(s) to shake on a plate shaker at room temperature for 2 hours. Optionally, control wells may be coated with 3.5 µg/ml of control Capture antibody (Whole Rabbit IgG molecules) prepared in SuperBlock TBS. Wash off excess FAKpY397 antibody 3 times using buffer. Block Anti-FAKpY397 coated plate(s) with 200 µl per well of 3%BSA/0.5%Tween Blocking buffer for 1 hour at room temperature on the plate shaker. While the plate(s) are blocking, prepare compound stock solutions of 5 mM in 100 % DMSO. The stock solutions are subsequently serially diluted to 100X of the final concentration in 100% DMSO. Make a 1:10 dilution using the 100X solution into growth media and transfer 10 µl of the appropriate compound dilutions to each well containing either the FAK induced or uninduced control A431 cells for 30 minutes at 37°C, 5% CO₂. Prepare RIPA lysis buffer (50 mM Tris-HCl, pH7.4, 1% NP-40, 0.25% Na-deoxycholate, 150 mM NaCl, 1 mM EDTA, 1 mM Na₃VO₄, 1 mM NaF, and one CompleteTM EDTA-free protease inhibitor pellet per 50 ml solution). At the end of 30 minutes compound treatment, wash off compound 3 times using TBS-T wash buffer. Lyse cells with 100 µl/well of RIPA buffer.

To the coated plate, remove blocking buffer and wash 3 times using TBS-T wash buffer. Using a 96-well automated microdispenser, transfer 100 µl of whole cell-lysate (from step 6) to the Goat Anti-Rabbit FAKpY397 coated plate(s) to capture phosphoFAKpY397 proteins. Shake at room temperature for 2 hours. Wash off unbound proteins 3 times using TBS-T wash buffer. Prepare 0.5 µg/ml (1:2000 dilution) of UBI αFAK detection antibody in 3%BSA/0.5% Tween blocking buffer. Dispense 100 µl of UBI αFAK solution per well and shake for 30 minutes at room temperature. Wash off excess UBI αFAK antibody 3 times using TBS-T wash buffer. Prepare 0.08 µg/ml (1:5000 dilution) of secondary Anti-Mouse Peroxidase (Anti-2MHRP) conjugated antibody. Dispense 100 µl per well of the Anti-2MHRP solution and shake for 30 minutes at room temperature. Wash off excess Anti-2MHRP antibody 3 times using TBS-T wash buffer. Add 100 µl per well of room temperature TMB substrate solution to allow for color development. Terminate the TMB reaction with 100 µl per well of TMB stop solution (0.09M H₂SO₄) and quantitate the signal by measurement of absorbance at 450 nm on the BioRad microplate reader.

Additional FAK cell assays are hereby incorporated by reference from Pfizer Attorney Docket No. PC11699 entitled "INDUCIBLE FOCAL ADHESION KINASE CELL ASSAY".

In a preferred embodiment, the compounds of the present invention have an in vivo activity as determined by a kinase assay, e.g., such as that described herein, of less than 100

nM. Preferably, the compounds have an IC₅₀ of less than 25 nM in the kinase assay, and more preferably less than 10 nM. In a further preferred embodiment, the compounds exhibit an IC₅₀ in a FAK cell based assay, e.g., such as that described herein, of less than 1 μ M, more preferably less than 100 nM, and most preferably less than 25 nM.

5 Administration of the compounds of the present invention (hereinafter the "active compound(s)") can be effected by any method that enables delivery of the compounds to the site of action. These methods include oral routes, intraduodenal routes, parenteral injection (including intravenous, subcutaneous, intramuscular, intravascular or infusion), topical, and rectal administration.

10 The amount of the active compound administered will be dependent on the subject being treated, the severity of the disorder or condition, the rate of administration, the disposition of the compound and the discretion of the prescribing physician. However, an effective dosage is in the range of about 0.001 to about 100 mg per kg body weight per day, preferably about 1 to about 35 mg/kg/day, in single or divided doses. For a 70 kg human, this would amount to about
15 0.05 to about 7 g/day, preferably about 0.2 to about 2.5 g/day. In some instances, dosage levels below the lower limit of the aforesaid range may be more than adequate, while in other cases still larger doses may be employed without causing any harmful side effect, provided that such larger doses are first divided into several small doses for administration throughout the day.

20 The active compound may be applied as a sole therapy or may involve one or more other anti-tumour substances, for example those selected from, for example, mitotic inhibitors, for example vinblastine; alkylating agents, for example cis-platin, carboplatin and cyclophosphamide; anti-metabolites, for example 5-fluorouracil, cytosine arabinoside and hydroxyurea, or, for example, one of the preferred anti-metabolites disclosed in European
25 Patent Application No. 239362 such as N-(5-[N-(3,4-dihydro-2-methyl-4-oxoquinazolin-6-ylmethyl)-N-methylamino]-2-thenoyl)-L-glutamic acid; growth factor inhibitors; cell cycle inhibitors; intercalating antibiotics, for example adriamycin and bleomycin; enzymes, for example interferon; and anti-hormones, for example anti-estrogens such as Nolvadex \square (tamoxifen) or, for example anti-androgens such as Casodex \square (4'-cyano-3-(4-fluorophenylsulphonyl)-2-hydroxy-2-methyl-3'-(trifluoromethyl)propionanilide). Such conjoint
30 treatment may be achieved by way of the simultaneous, sequential or separate dosing of the individual components of the treatment.

The pharmaceutical composition may, for example, be in a form suitable for oral administration as a tablet, capsule, pill, powder, sustained release formulations, solution,
35 suspension, for parenteral injection as a sterile solution, suspension or emulsion, for topical administration as an ointment or cream or for rectal administration as a suppository. The

pharmaceutical composition may be in unit dosage forms suitable for single administration of precise dosages. The pharmaceutical composition will include a conventional pharmaceutical carrier or excipient and a compound according to the invention as an active ingredient. In addition, it may include other medicinal or pharmaceutical agents, carriers, adjuvants, etc.

5 Exemplary parenteral administration forms include solutions or suspensions of active compounds in sterile aqueous solutions, for example, aqueous propylene glycol or dextrose solutions. Such dosage forms can be suitably buffered, if desired.

Suitable pharmaceutical carriers include inert diluents or fillers, water and various organic solvents. The pharmaceutical compositions may, if desired, contain additional
10 ingredients such as flavorings, binders, excipients and the like. Thus for oral administration, tablets containing various excipients, such as citric acid may be employed together with various disintegrants such as starch, alginic acid and certain complex silicates and with binding agents such as sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, sodium lauryl sulfate and talc are often useful for tableting purposes. Solid
15 compositions of a similar type may also be employed in soft and hard filled gelatin capsules. Preferred materials, therefor, include lactose or milk sugar and high molecular weight polyethylene glycols. When aqueous suspensions or elixirs are desired for oral administration the active compound therein may be combined with various sweetening or flavoring agents, coloring matters or dyes and, if desired, emulsifying agents or suspending agents, together with
20 diluents such as water, ethanol, propylene glycol, glycerin, or combinations thereof.

Methods of preparing various pharmaceutical compositions with a specific amount of active compound are known, or will be apparent, to those skilled in this art. For examples, see Remington's Pharmaceutical Sciences, Mack Publishing Company, Easter, Pa., 15th Edition (1975).

25 The examples and preparations provided below further illustrate and exemplify the compounds of the present invention and methods of preparing such compounds. It is to be understood that the scope of the present invention is not limited in any way by the scope of the following examples and preparations. In the following examples molecules with a single chiral center, unless otherwise noted, exist as a racemic mixture. Those molecules with two
30 or more chiral centers, unless otherwise noted, exist as a racemic mixture of diastereomers. Single enantiomers/diastereomers may be obtained by methods known to those skilled in the art.

Where HPLC chromatography is referred to in the preparations and examples below, the general conditions used, unless otherwise indicated, are as follows. The column used is a
35 ZORBAX[®] RXC18 column (manufactured by Hewlett Packard) of 150 mm distance and 4.6 mm interior diameter. The samples are run on a Hewlett Packard-1100 system. A gradient

solvent method is used running 100 percent ammonium acetate / acetic acid buffer (0.2 M) to 100 percent acetonitrile over 10 minutes. The system then proceeds on a wash cycle with 100 percent acetonitrile for 1.5 minutes and then 100 percent buffer solution for 3 minutes. The flow rate over this period is a constant 3 ml / minute.

- 5 In the following examples and preparations, "Et" means ethyl, "Ac" means acetyl, "Me" means methyl, and "Bu" means butyl.

Examples

General Methods:

Preparation of 5-nitro-oxindole:

- 10 To a solution of oxindole (26 g) in 100 mL of concentrated sulfuric acid at -15°C was added fuming nitric acid (8.4 mL) dropwise. Careful attention was paid to maintain the reaction temperature at -15°C. After the addition was complete, the reaction was stirred for 30 minutes and then poured into ice water. A yellow precipitate was formed which was isolated by filtration to provide 34 grams (98%) of 5-nitro oxindole.

Preparation of 5-amino-oxindole (2):

- 15 To a solution of 5-nitro-oxindole (25 g) in 120 mL of dimethylacetamide in a Parr bottle was added 10% Pd/C (0.5 g). The mixture was hydrogenated (40 psi H₂) for 16 h. The catalyst was removed by filtration and the filtrate was diluted with ether (2L) to provide 5-amino-oxindole (10.5 g; 50%).

Preparation of 2,4-dichloro-5-trifluoromethylpyrimidine (3):

- 20 5-Trifluoromethyluracil (250g, 1.39 mol) and phosphorous oxychloride (655 mL, 6.94 mol, 5 equiv) were charged to a 3L 4-neck flask equipped with overhead stirrer, a reflux condenser, an addition funnel and an internal thermocouple. The contents were maintained under a nitrogen atmosphere as concentrated phosphoric acid (85 wt%, 9.5 mL, 0.1 equiv)
- 25 was added in one portion to the slurry, resulting in a moderate exotherm. Diisopropylethylamine (245 mL, 1.39 mol, 1 equiv) was then added dropwise over 15 min at such a rate that the internal temperature of the reaction reached 85–90 °C by the end of the addition. By the end of the amine addition the reaction mixture was a homogenous light-orange solution. Heating was initiated and the orange solution was maintained at 100 °C for
- 30 20h, at which time HPLC analysis of the reaction mixture indicated that the starting material was consumed. External heating was removed and the contents of the flask were cooled to 40 °C and then added dropwise to a cooled mixture of 3N HCl (5 L, 10 equiv) and diethyl ether (2L) keeping the temperature of the quench pot between 10 and 15 °C. The layers were separated, and the aqueous layer was extracted once with ether (1L). The combined organic
- 35 layers were combined, washed with water until the washes were neutral (5 × 1.5L washes), dried with MgSO₄ and concentrated to provide 288g (95% yield) of a light yellow-orange oil of

96% purity (HPLC). This material can be further purified by distillation (bp 109 °C at 79 mmHg).

Preparation of 5-(4-Chloro-5-trifluoromethyl-pyrimidin-2-ylamino)-1,3-dihydro-indol-2-one (4):

5 To a solution of 5-trifluoromethyl-2,4-dichloropyrimidine (214.8 g; 0.921 mol) in 1:1 DCE/tBuOH (1.240 L) was added Zinc chloride 1M solution in ether (1 eq; 0.921 L). After 0.5 hour, 5-amino-oxindole (124 g; 0.837 mol) was added followed by triethylamine (129.4 ml; 0.921 mol) keeping temperature at 25° C. The reaction was allowed to stir at room temperature overnight, then was concentrated and the product triturated from methanol as a
10 yellow solid (224.3 g; 82%). ¹H NMR (DMSO-d₆, 400 MHz) □ 3.29 (s, 2H), 6.76 (d, J = 7.9 Hz, 2H), 7.39 (d, J = 8.3 Hz), 7.51 (br s, 1H), 8.71 (s, 1H), 10.33 (s, 1H), 10.49 (s, 1H). ¹³C NMR (DMSO-d₆, 100 MHz) □ 177.0, 161.3, 158.7 (br), 140.7, 132.8, 126.9, 123.7 (q, J = 268 Hz), 121.0, 118.7, 111.2 (q, J = 32 Hz), 109.6, 36.7; HPLC ret. time: 5.759 min. Example 1

5-[4-(R-1-Phenyl-ethylamino)-5-trifluoromethyl-pyrimidin-2-ylamino]-1,3-dihydro-indol-2-one

To a solution of 1:1 DCE/t-BuOH alcohol (1:1 ratio, 4 mL) and 5-(4-Chloro-5-trifluoromethyl-pyrimidin-2-ylamino)-1,3-dihydro-indol-2-one (0.15 g; 0.456 mmole) was added
20 (R)(+) alpha phenethyl amine (0.071 mL; 0.547 mmole) and diisopropyl ethyl amine (0.081 mL, 0.456 mmole). The resultant solution was stirred under nitrogen and heated to 80°C for 16 hours. The reaction was cooled to room temperature, diluted with ~10 mL of a 1:1 mixture of dichloromethane and methanol followed by the addition of 0.5 g of MP-carbonate. The resultant mixture was stirred, filtered, concentrated and purified by silica gel chromatography
25 (97:2.8:0.3 ratio of chloroform/methanol/concentrated ammonium hydroxide). The desired title compounds was obtained as a white solid (0.021 g; 11%). HPLC ret. time: 6.46 min. LRMS (M+) 413.4

The following compounds of the invention were prepared by heating chloropyrimidine (4) with an appropriate amine as in Example 1. Amines used in these reactions were either
30 obtained commercially and used as received or alternatively they were prepared by common

synthetic methods for amines known to those skilled in the art. Unless otherwise noted, compounds having chiral centers were prepared as racemic mixtures.
